Basic Algebraic Operations

1.1 Numbers

1. The numbers -7 and 12 are integers. They are also rational numbers since they can be written as $\frac{-7}{1}$ and $\frac{12}{1}$.
2. The absolute value of -6 is 6 , and the absolute value of -7 is 7 . We write these as $|-6| = 6$ and $|-7| = 7$.
3. $-6 < -4$; -6 is to the left of -4 .

4. The reciprocal of $\frac{3}{2}$ is $\frac{1}{3/2} = 1 \times \frac{2}{3} = \frac{2}{3}$.
5. 3 is an integer, rational $\left(\frac{3}{1}\right)$, and real.
 $\sqrt{-4}$ is imaginary.
6. $\frac{\sqrt{7}}{3}$ is irrational (because $\sqrt{7}$ is an irrational number) and real.
 -6 is an integer, rational $\left(\frac{-6}{1}\right)$, and real.
7. $-\frac{\pi}{6}$ is irrational (because π is an irrational number) and real.
 $\frac{1}{8}$ is rational and real.
8. $-\sqrt{-6}$ is imaginary.
 $-2.33 = \frac{-233}{100}$ is rational and real.
9. $|3| = 3$
 $|-3| = 3$
 $\left|-\frac{\pi}{2}\right| = \frac{\pi}{2}$
10. $|-0.857| = 0.857$
 $|\sqrt{2}| = \sqrt{2}$
 $\left|-\frac{19}{4}\right| = \frac{19}{4}$

2 Chapter 1 Basic Algebraic Operations

11. $6 < 8$; 6 is to the left of 8.

12. $7 > 5$; 7 is to the right of 5.

13. $\pi < 3.1416$; π (3.1415926...) is to the left of 3.1416.

14. $-4 < 0$; -4 is to the left of 0.

15. $-4 < -|-3|$; -4 is to the left of $-|-3|$, $(-|-3| = -(3) = -3)$.

16. $-\sqrt{2} > -1.42$; $(-\sqrt{2} = -(1.414...) = -1.414...)$, $-\sqrt{2}$ is to the right of -1.42.

17. $-\frac{2}{3} > -\frac{3}{4}$; $-\frac{2}{3} = -0.666...$ is to the right of $-\frac{3}{4} = -0.75$.

18. $-0.6 < 0.2$; -0.6 is to the left of 0.2.

19. The reciprocal of 3 is $\frac{1}{3}$.

The reciprocal of $-\frac{4}{\sqrt{3}}$ is $-\frac{1}{4/\sqrt{3}} = -\frac{\sqrt{3}}{4}$.

The reciprocal of $\frac{y}{b}$ is $\frac{1}{y/b} = \frac{b}{y}$.

20. The reciprocal of $-\frac{1}{3}$ is $-\frac{1}{1/3} = -\frac{3}{1} = -3$.

The reciprocal of $0.25 = \frac{1}{4}$ is $\frac{1}{1/4} = \frac{4}{1} = 4$.

The reciprocal of $2x$ is $\frac{1}{2x}$.

21. Find 2.5 , $-\frac{12}{5} = -2.4$; $-\frac{3}{4} = -0.75$; $\sqrt{3} = 1.732...$

22. Find $-\frac{7}{3} = -2.333...$; $-\frac{\sqrt{2}}{2} = -\frac{1.414...}{2} = -0.707$; $2\pi = 2 \times 3.14... = 6.28$; $\frac{123}{19} = 6.47$.

23. An absolute value is not always positive, $|0| = 0$ which is not positive.

24. Since $-2.17 = -\frac{217}{100}$, it is rational.

25. The reciprocal of the reciprocal of any positive or negative number is the number itself.

The reciprocal of n is $\frac{1}{n}$; the reciprocal of $\frac{1}{n}$ is $\frac{1}{1/n} = 1 \cdot \frac{n}{1} = n$.

26. Any repeating decimal is rational, so $2.\overline{72}$ is rational. It turns out that $2.\overline{72} = \frac{30}{11}$.

27. It is true that any nonterminating, nonrepeating decimal is an irrational number.

4 Chapter 1 Basic Algebraic Operations

28. No, $|b-a| = |b| - |a|$, as shown below.

If $a > 0$, then $|a| = a$.

If $b > a$ and $a > 0$, then $|b| = b$.

If $b > a$ then $b - a > 0$, then $|b-a| = b-a$.

Therefore, $|b-a| = b-a = |b| - |a|$.

The two sides of the expression are equivalent, one side is not less than the other.

29. List these numbers from smallest to largest: -1 , 9 , $\pi = 3.14$, $\sqrt{5} = 2.236$, $|-8| = 8$, $-|-3| = -3$, -3.1 .

So, from smallest to largest, they are -3.1 , $-|-3|$, -1 , $\sqrt{5}$, π , $|-8|$, 9 .

30. List these numbers from smallest to largest: $\frac{1}{5} = 0.20$, $-\sqrt{10} = -3.16\dots$, $-|-6| = -6$, -4 , 0.25 , $|\pi| = 3.14\dots$.

So, from smallest to largest, they are $-|-6|$, -4 , $-\sqrt{10}$, $\frac{1}{5}$, 0.25 , $|\pi|$.

31. If a and b are positive integers and $b > a$, then

(a) $b-a$ is a positive integer.

(b) $a-b$ is a negative integer.

(c) $\frac{b-a}{b+a}$, the numerator and denominator are both positive, but the numerator is less than the denominator, so the answer is a positive rational number that is less than 1.

32. If a and b are positive integers, then

(a) $a+b$ is a positive integer

(b) a/b is a positive rational number

(c) $a \times b$ is a positive integer

33. (a) Is the absolute value of a positive or a negative integer always an integer?

$|x| = x$, so the absolute value of a positive integer is an integer.

$|-x| = x$, so the absolute value of a negative integer is an integer.

(b) Is the reciprocal of a positive or negative integer always a rational number?

If x is a positive or negative integer, then the reciprocal of x is $\frac{1}{x}$. Since both 1 and x are integers, the reciprocal is a rational number.

34. (a) Is the absolute value of a positive or negative rational number rational?
 $|x| = x$, so if x is a positive or negative rational number, the absolute value of it is also a rational number.
- (b) Is the reciprocal of a positive or negative rational number a rational number?

A rational number is a number that can be expressed as a fraction where both the numerator and denominator are integers and the denominator is not zero. So a rational number $\frac{\text{integer } a}{\text{integer } b}$ has a reciprocal of

$$\frac{1}{\frac{\text{integer } a}{\text{integer } b}} = \frac{\text{integer } b}{\text{integer } a}, \text{ which is also a rational number if integer } a \text{ is not zero.}$$

35. (a) If $x > 0$, then x is a positive number located to the right of zero on the number line.

- (b) If $x < -4$, then x is a negative number located to the left of -4 on the number line.

36. (a) If $|x| < 1$, then $-1 < x < 1$.

- (b) $|x| > 2$, then $x < -2$ or $x > 2$.

37. If $x > 1$, then $\frac{1}{x}$ is a positive number less than 1. Or $0 < \frac{1}{x} < 1$.

38. If $x < 0$, then $|x|$ is a positive number greater than zero.

39. $a + bj = a + b\sqrt{-1}$ is a real number when $\sqrt{-1}$ is eliminated, which is when $b = 0$. So $a + bj$ is a real number for all real values of a and $b = 0$.

6 Chapter 1 Basic Algebraic Operations

40. The variables are w and t .
The constants are c , 0.1 , and 1 .

41. $\frac{1}{C_T} = \frac{1}{C_1} + \frac{1}{C_2}$. Find C_T , where $C_1 = 0.0040\text{ F}$ and $C_2 = 0.0010\text{ F}$.

$$\frac{1}{C_T} = \frac{1}{0.0040} + \frac{1}{0.0010}$$

$$\frac{1}{C_T} = \frac{1(0.0040) + 1(0.0010)}{0.0040 \times 0.0010}$$

$$C_T = \frac{0.0040 \times 0.0010}{0.0040 + 0.0010} = \frac{0.0000040}{0.0050}$$

$$C_T = 0.00080\text{ F}$$

42. $|100V| = 100V$
 $|-200V| = 200V$
 $|-200V| > |100V|$

43. $N = \frac{a \text{ bits}}{\text{bytes}} \times \frac{1000 \text{ bytes}}{1 \text{ kilobyte}} \times n \text{ kilobytes}$
 $N = 1000 \text{ an bits}$

44.

x = length of base in m

y = the shortened length in centimetres.

$100x$ = length of base in cm

$y + L = 100x$, all dimensions in cm

$$L = 100x - y$$

45. Yes, $-20^\circ\text{C} > -30^\circ\text{C}$ because -30°C is found to the left of -20°C on the number line.

46. For $I < 4\text{ A}$, $R > 12\ \Omega$.

1.2 Fundamental Operations of Algebra

1. $16 - 2 \times (-2) = 16 - (-4) = 16 + 4 = 20$
2. $\frac{-18}{-6} + 5 - (-2)(3) = 3 + 5 - (-6) = 8 + 6 = 14$
3. $\frac{-12}{8-2} + \frac{5-1}{2(-1)} = \frac{-12}{6} + \frac{4}{-2} = -2 + (-2) = -4$
4. $\frac{7 \times 6}{0 \times 0} = \frac{42}{0}$ is undefined, not indeterminate.
5. $5 + (-8) = 5 - 8 = -3$
6. $-4 + (-7) = -4 - 7 = -11$
7. $-3 + 9 = 6$ or alternatively

 $18 - 21 = -(21 - 18) = -(3) = -3$
9. $-19 - (-16) = -19 + 16 = -3$
10. $-8 - (-10) = -8 + 10 = 2$
11. $7(-4) = -(7 \times 4) = -28$

17. $-2(4)(-5) = -8(-5) = 40$
18. $-3(-4)(-6) = 12(-6) = -72$

10 Chapter 1 Basic Algebraic Operations

50. $-a - (-b) = -a + b = b - a$, which is expression (c).

51. Since $|5 - (-2)| = |5 + 2| = 7$ and $|-5 - (-2)| = |-5 + 2| = |-3| = 3$,
 $|5 - (-2)| > |-5 - (-2)|$.

52. Since $|-3 - (-7)| = |-3 - 7| = |-10| = 10$ and $||-3| - 7| = |3 - 7| = |-4| = 4$,
 $|-3 - (-7)| > ||-3| - 7|$.

53. (a) The sign of a product of an even number of negative numbers is positive. Example: $-3(-6) = 18$

(b) The sign of a product of an odd number of negative numbers is negative.
 Example: $-5(-4)(-2) = -40$

54. Subtraction is not commutative because $x - y \neq y - x$. Example: $7 - 5 = 2$ does not equal $5 - 7 = -2$

55. Yes, from the definition in Section 1.1, the absolute value of a positive number is the number itself, and the absolute value of a negative number is the corresponding positive number. So for values of x where $x > 0$ (positive) or $x = 0$ (neutral) then $|x| = x$.

Example: $|4| = 4$.

The claim that absolute values of negative numbers $|x| = -x$ is also true.

Example: if x is -6 , then $|-6| = -(-6) = 6$.

56. The incorrect answer was achieved by subtracting before multiplying or dividing which violates the order of operations.

$24 - 6 \div 2 \times 3 \neq 18 \div 2 \times 3 = 9 \times 3 = 27$

The correct value is:

$24 - 6 \div 2 \times 3 = 24 - 3 \times 3 = 24 - 9 = 15$

57. (a) $-xy = 1$ is true for values of x and y that are negative reciprocals of each other or $y = -\frac{1}{x}$, providing that the

number x in the denominator is not zero. So if $x = 12$, then $y = -\frac{1}{12}$ and $-xy = -(12)\left(-\frac{1}{12}\right) = 1$.

(b) $\frac{x-y}{x-y} = 1$ is true for all values of x and y , providing that $x \neq y$ to prevent division by zero.

58. (a) $|x + y| = |x| + |y|$ is true for values where both x and y have the same sign or either are zero:

$|x + y| = |x| + |y|$, when $x \geq 0$ and $y \geq 0$ or when $x \leq 0$ and $y \leq 0$

Example:

$|6 + 3| = 6 + 3 = 9$ and

$|6| + |3| = 6 + 3 = 9$

Also,

$|-6 + (-3)| = |-9| = 9$

$|-6| + |-3| = 6 + 3 = 9$

$|x + y| = |x| + |y|$ is not true however, when x and y have opposite signs

$|x + y| \neq |x| + |y|$, when $x > 0$ and $y < 0$; or $x < 0$ and $y > 0$.

Example:

$$|-21 + 6| = |-15| = 15,$$

$$|-21| + |6| = 21 + 6 = 27 \neq 15$$

$$|4 + (-5)| = |-1| = 1,$$

$$|4| + |-5| = 4 + 5 = 9 \neq 1$$

- (b) In order for $|x - y| = |x| + |y|$ it is necessary that they have opposite signs or either to be zero. Symbolically, $|x - y| = |x| + |y|$ when $x \geq 0$ and $y \leq 0$; or when $x \leq 0$ and $y \geq 0$.

Example:

$$|6 - (-3)| = 6 + 3 = 9 \text{ and}$$

$$|6| + |-3| = 6 + 3 = 9$$

Example:

$$|-11 - 7| = |-18| = 18$$

$$|-11| + |-7| = 11 + 7 = 18$$

$|x - y| = |x| + |y|$ is not true, however, when x and y have the same signs.

$|x - y| \neq |x| + |y|$, when $x > 0$ and $y > 0$; or $x < 0$ and $y < 0$.

Example:

$$|21 - 6| = |15| = 15,$$

$$|21| + |6| = 27 \neq 15$$

59. The total change in the price of the stock is $-0.68 + 0.42 + 0.06 + (-0.11) + 0.02 = -0.29$.

60. The difference in altitude is $-86 - (-1396) = 1396 - 86 = 1310$ m

61. The change in the meter energy reading E would be:

$$E_{\text{change}} = E_{\text{used}} - E_{\text{generated}}$$

$$E_{\text{change}} = 2.1 \text{ kW} \cdot \text{h} - 1.5 \text{ kW} (3.0 \text{ h})$$

$$E_{\text{change}} = 2.1 \text{ kW} \cdot \text{h} - 4.5 \text{ kW} \cdot \text{h}$$

$$E_{\text{change}} = -2.4 \text{ kW} \cdot \text{h}$$

62. Assuming that this batting average is for the current season only which is just starting, the number of hits is zero and the total number of at-bats is also zero giving us a batting average $= \frac{\text{number of hits}}{\text{at - bats}} = \frac{0}{0}$ which is indeterminate, not 0.000.

63. The average temperature for the week is:

$$T_{\text{avg}} = \frac{-7 + (-3) + 2 + 3 + 1 + (-4) + (-6)}{7} \text{ } ^\circ\text{C}$$

$$T_{\text{avg}} = \frac{-7 - 3 + 2 + 3 + 1 - 4 - 6}{7} \text{ } ^\circ\text{C}$$

$$T_{\text{avg}} = \frac{-14}{7} \text{ } ^\circ\text{C} = -2.0 \text{ } ^\circ\text{C}$$

64. The vertical distance from the flare gun is

$$d = (70)(5) + (-16)(25)$$

$$d = 350 + (-400)$$

$$d = 350 - 400$$

$$d = -50 \text{ m}$$

The flare is 50 m below the flare gun.

65. The sum of the voltages is

$$V_{sum} = 6\text{V} + (-2\text{V}) + 8\text{V} + (-5\text{V}) + 3\text{V}$$

$$V_{sum} = 6\text{V} - 2\text{V} + 8\text{V} - 5\text{V} + 3\text{V}$$

$$V_{sum} = 10\text{V}$$

66. (a) The change in the current for the first interval is the second reading – the first reading

$$\text{Change}_1 = -2 \text{ lb/in}^2 - 7 \text{ lb/in}^2 = -9 \text{ lb/in}^2.$$

- (b) The change in the current for the middle intervals is the third reading – the second reading

$$\text{Change}_2 = -9 \text{ lb/in}^2 - (-2 \text{ lb/in}^2) = -9 \text{ lb/in}^2 + 2 \text{ lb/in}^2 = -7 \text{ lb/in}^2.$$

- (c) The change in the current for the last interval is the last reading – the third reading

$$\text{Change}_3 = -6 \text{ lb/in}^2 - (-9 \text{ lb/in}^2) = -6 \text{ lb/in}^2 + 9 \text{ lb/in}^2 = 3 \text{ lb/in}^2.$$

67. The oil drilled by the first well is $100 \text{ m} + 200 \text{ m} = 300 \text{ m}$ which equals the depth drilled by the second well $200 \text{ m} + 100 \text{ m} = 300 \text{ m}$.

$$t = 7 \text{ days} \times 25 \frac{\text{minutes}}{\text{day}} + 7 \text{ days} \times 15 \frac{\text{minutes}}{\text{day}}$$

$$t = 175 \text{ min} + 105 \text{ min}$$

$$t = 280 \text{ min}$$

OR

$$t = 7 \text{ days} \times (25 + 15) \frac{\text{minutes}}{\text{day}}$$

$$t = 7 \text{ days} \times 40 \frac{\text{minutes}}{\text{day}}$$

70. Distance = rate $\times$ time

$$d = 600 \frac{\text{km}}{\text{h}} + 50 \frac{\text{km}}{\text{h}} \quad 3 \text{ h}$$

$$d = 600 \frac{\text{km}}{\text{h}} (3\text{h}) + 50 \frac{\text{km}}{\text{h}} (3\text{h})$$

$$d = 1800 \text{ km} + 150 \text{ km} = 1950 \text{ km}$$

OR

$$d = 600 \frac{\text{km}}{\text{h}} + 50 \frac{\text{km}}{\text{h}} \quad 3 \text{ h}$$

$$d = 650 \frac{\text{km}}{\text{h}} \quad 3 \text{ h}$$

$$d = 1950 \text{ km}$$

55. $\sqrt{a^2} = a$ is not necessarily true for negative values of a because a^2 will be a positive number, regardless whether a is negative or positive. The principal root calculated is assumed to be positive, but there are always two solutions to a square root, $\sqrt{a^2} = \pm a$ since $(+a)^2 = a^2$ and $(-a)^2 = a^2$ (see the introduction to this chapter section), so it is sometimes true and sometimes false for negative values of a , depending on which root solution is desired. If *only principal roots* are considered, then it will *not* be true for negative values of a . For example, $\sqrt{(-4)^2} = \sqrt{16} = 4 \neq -4$.

56. (a) $x > \sqrt{x}$ when $x > 1$. Any number greater than 1 will have a square root that is smaller than itself. For example, $2 > \sqrt{2} = 1.41$
 (b) $x = \sqrt{x}$ when $x = 1$ or $x = 0$ because the only numbers that are their own squares are 0 and 1 (i.e., $0^2 = 0$ and $1^2 = 1$).
 (c) $x < \sqrt{x}$ when $0 < x < 1$. Any number between 0 and 1 will have a square root larger than itself. For example, $0.25 < \sqrt{0.25} = 0.5$

57. (a) $\sqrt[3]{2140} = 12.8865874254$, which is rounded to 12.9

1. Let x = the number of 25 W lights.

Let $31 - x$ = the number of 40 W lights.

$$25x + 40(31 - x) = 1000$$

$$25x + 1240 - 40x = 1000$$

$$-15x = 1000 - 1240$$

$$-15x = -240$$

$$x = 16$$

There are 16 of the 25 W lights and $(31 - 16) = 15$ of the 40 W lights.

Check:

$$25 \cdot 16 + 40(31 - 16) = 1000$$

$$400 + 40(15) = 1000$$

$$400 + 600 = 1000$$

$$x = 0.41666667 \text{ h} \times 60 \text{ min/h}$$

$$x = 25 \text{ min}$$

There is 25 minutes left until the executive's appointment.

Check:

$$60.0 \text{ mi/h} \left(0.41667 \text{ h} - \frac{10.0 \text{ min}}{60 \text{ min/h}} \right) = 45 \text{ mi/h} \left(0.41667 \text{ h} - \frac{5.0 \text{ min}}{60 \text{ min/h}} \right)$$

$$60.0 \text{ mi/h}(0.25 \text{ h}) = 45 \text{ mi/h}(0.33333 \text{ h})$$

$$15 \text{ mi} = 15 \text{ mi}$$

27. Let $x - 30.0$ s = time since the first car started moving in the race in seconds.

Let x = time since the second car started the race in seconds.

The distance travelled by each car will be the same at the point where the first car overtakes the second car.

Distance = speed $\times$ time.

$$260.0 \text{ ft/s}(x - 30.0 \text{ s}) = 240.0 \text{ ft/s}(x)$$

$$(260.0 \text{ ft/s})x - (260.0 \text{ ft/s})(30.0 \text{ s}) = (240.0 \text{ ft/s})x$$

$$(260.0 \text{ ft/s})x - 7800 \text{ ft} = (240.0 \text{ ft/s})x$$

$$(20.0 \text{ ft/s})x = 7800 \text{ ft}$$

$$x = \frac{7800 \text{ ft}}{20.0 \text{ ft/s}}$$

$$x = 390 \text{ s}$$

The first car will overtake the second car after 390 s. The first car travels $260 \text{ ft/s} \times (390 \text{ s} - 30 \text{ s}) = 93600 \text{ ft}$ by this point. 8 laps around the track is 2.5 mi/lap. $8 \text{ laps} \times 5280 \text{ ft/mi} = 105,600 \text{ ft}$, so the first car will already be in the lead at the end of the 8th lap.

Check:

$$260.0 \text{ ft/s}(390.0 \text{ s} - 30.0 \text{ s}) = 240.0 \text{ ft/s}(390 \text{ s})$$

$$260.0 \text{ ft/s}(360.0 \text{ s}) = 240.0 \text{ ft/s}(390 \text{ s})$$

$$93,600 \text{ ft} = 93,600 \text{ ft}$$

28. Let x = the number of the first chips that is defective 0.50%.
 Let $6100 - x$ = the number of the second chips that is defective 0.80%.
 $0.0050(x) + 0.0080(6100 \text{ chips} - x) = 38 \text{ chips}$
 $(0.0050)x + 48.8 \text{ chips} - (0.0080)x = 38 \text{ chips}$

$$-(0.0030)x = -10.8 \text{ chips}$$

$$x = \frac{-10.8 \text{ chips}}{-0.0030}$$

$$x = 3600 \text{ chips}$$

There are 3600 chips that are 0.50% defective and $(6100 \text{ chips} - 3600 \text{ chips}) = 2500 \text{ chips}$ that are defective 0.80%.
 Check:

$$0.0050(3600 \text{ chips}) + 0.0080(6100 \text{ chips} - 3600 \text{ chips}) = 38 \text{ chips}$$

$$18 \text{ chips} + 0.0080(2500 \text{ chips}) = 38 \text{ chips}$$

$$18 \text{ chips} + 20 \text{ chips} = 38 \text{ chips}$$

$$38 \text{ chips} = 38 \text{ chips}$$

Assuming that the customer is located between the two gasoline distributors:

Let x = the distance in km to the first gasoline distributor that costs \$2.90/gal.

Let $228 \text{ mi} - x$ = the distance in km to the second gasoline distributor that costs \$2.70/gal.

$$\$2.90 + \$0.002(x) = \$2.70 + \$0.002(228 - x)$$

$$\$2.90 + \$0.002(x) = \$2.70 + \$0.456 - \$0.002(x)$$

$$\$0.004(x) = \$0.256$$

$$x = \frac{\$0.256}{\$0.004}$$

$$x = 64 \text{ mi}$$

The customer is 64 mi away from the first gas distributor (\$2.90/gal) and $(228 \text{ mi} - 64 \text{ mi}) = 164 \text{ mi}$ away from the second gas distributor (\$2.70).

Check:

$$\$2.90 + \$0.002(64) = \$2.70 + \$0.002(228 - 64)$$

$$\$2.90 + \$0.128 = \$2.70 + \$0.002(164)$$

$$\$3.028 = \$2.70 + \$0.328$$

$$\$3.028 = \$3.028$$

A 15:1 gas/oil mixture is $15/16$ gasoline = 93.75%.

Let x = the amount of 100% gasoline added in L.

Let $8.0 \text{ L} - x$ = the amount of 75% gasoline mixture in L.

82 Chapter 1 Basic Algebraic Operations

$$1.00(x) + 0.75(8.0 \text{ L} - x) = 0.9375(8.0 \text{ L})$$

$$1.00(x) + 6.0 \text{ L} - 0.75(x) = 7.5 \text{ L}$$

$$0.25(x) = 1.5 \text{ L}$$

$$x = \frac{1.5 \text{ L}}{0.25}$$

$$x = 6.0 \text{ L}$$

6.0 L of 100% gasoline must be added to the 75% gas/oil mixture to make 8 L of 15:1 gasoline/ oil.

Check:

$$1.00(6.0 \text{ L}) + 0.75(8.0 \text{ L} - 6.0 \text{ L}) = 0.9375(8.0 \text{ L})$$

$$6 \text{ L} + 0.75(2.0 \text{ L}) = 7.5 \text{ L}$$

$$6 \text{ L} + 1.5 \text{ L} = 7.5 \text{ L}$$

$$7.5 \text{ L} = 7.5 \text{ L}$$

31.

Let x = the amount in L of 25% antifreeze left in radiator

Let $12.0 \text{ L} - x$ = the amount of 100% antifreeze added in L.

$$0.25(x) + 1.00(12.0 \text{ L} - x) = 0.5(12.0 \text{ L})$$

$$0.25(x) + 12.0 \text{ L} - 1.00(x) = 6.0 \text{ L}$$

$$-0.75(x) = -6.0 \text{ L}$$

$$x = \frac{-6.0 \text{ L}}{-0.75}$$

$$x = 8.0 \text{ L}$$

There needs to be 8L of 25% antifreeze left in radiator, so $(12.0 \text{ L} - 8.0 \text{ L}) = 4.0 \text{ L}$ must be drained.

Check:

$$0.25(8.0 \text{ L}) + 1.00(12.0 \text{ L} - 8.0 \text{ L}) = 0.5(12.0 \text{ L})$$

$$2.0 \text{ L} + 1.00(4.0 \text{ L}) = 6.0 \text{ L}$$

$$2.0 \text{ L} + 4.0 \text{ L} = 6.0 \text{ L}$$

$$6.0 \text{ L} = 6.0 \text{ L}$$

$$1.00(x) + 0.22(250 \text{ lb}) = 0.25(250 \text{ lb} + x)$$

$$1.00(x) + 55 \text{ lb} = 62.5 \text{ lb} + 0.25(x)$$

$$0.75(x) = 7.5 \text{ lb}$$

$$x = \frac{7.5 \text{ lb}}{0.75}$$

$$x = 10 \text{ lb}$$

Check:

$$1.00(10 \text{ lb}) + 0.22(250 \text{ lb}) = 0.25(250 \text{ lb} + 10 \text{ lb})$$

$$10 \text{ lb} + 55 \text{ lb} = 62.5 \text{ lb} + 2.5 \text{ lb}$$

$$65 \text{ lb} = 65 \text{ lb}$$

Speed = distance/time. 10 s is $10\text{s}/3600 \text{ s/h} = 0.002777777 \text{ h}$.

$$x = \frac{\text{distance needed to pass truck} + \text{distance travelled by truck in 10s}}{10\text{s}}$$

$$x = \frac{0.025 \text{ km} + 70 \text{ km/h}(0.00277777 \text{ h})}{0.00277777 \text{ h}}$$

$$x = \frac{0.025 \text{ km} + 0.19444 \text{ km}}{0.00277777 \text{ h}}$$

$$x = \frac{2.19444 \text{ km}}{0.00277777 \text{ h}}$$

$$x = 79 \text{ km/h}$$

The car needs to travel at a speed of 79 km/h to pass the semitrailer in 10s.

Check:

$$79 \text{ km/h} = \frac{0.025 \text{ km} + 70 \text{ km/h}(0.00277777 \text{ h})}{0.00277777 \text{ h}}$$

$$79 \text{ km/h} = \frac{0.025 \text{ km} + 0.19444 \text{ km}}{0.00277777 \text{ h}}$$

$$79 \text{ km/h} = 79 \text{ km/h}$$

34.

Let x = the time the first wave takes to travel to the seismic station in s.

Let $x + 120 \text{ s}$ = the time the first wave takes to travel to the seismic station in s.

Distance = speed $\times$ time. The distances travelled by both waves to the seismic station are the same. 2.0 min is $(2.0 \text{ min} \times 60 \text{ s/min}) = 120 \text{ s}$.

84 **Chapter 1** Basic Algebraic Operations

$$8.0 \text{ km/s}(x) = 5.0 \text{ km/s}(x + 120 \text{ s})$$

$$8.0 \text{ km/s}(x) = 5.0 \text{ km/s}(x) + (5 \text{ km/s})(120 \text{ s})$$

$$3.0 \text{ km/s}(x) = 600 \text{ km}$$

$$x = \frac{600 \text{ km}}{3.0 \text{ km/s}}$$

$$x = 200 \text{ s}$$

The distance to the seismic station is $(200 \text{ s} \times 8.0 \text{ km/s}) = 1600 \text{ km}$.

Check:

$$8.0 \text{ km/s}(200 \text{ s}) = 5.0 \text{ km/s}(200 \text{ s} + 120 \text{ s})$$

$$1600 \text{ km} = 5.0 \text{ km/s}(320 \text{ s})$$

$$1600 \text{ km} = 1600 \text{ km}$$

The first possibility, $x = 1$, yields $|-3| + 6 = 3$ or $9 = 3$, which is false.

The second possibility, $x = 5/2$, yields $|-3/2| + 6 = 15/2$ or $15/2 = 15/2$, which is true, and so the only solution is $x = 5/2$.

$$8 \div (4 \div 2) = 8 \div 2 = 4$$

Division is not associative.
