SHORT ANSWER. Write the word or phrase that best completes each statement or answers the question.

Provide an appropriate response.

328) You go to the bank to cash three checks. The checks are for $42.56, $157.20, and $70.44. You are given $227.64 by the teller. Estimate to see if the amount given you seems to be correct. Does $227.64 seem to be correct? Explain your answer.

Answer: No; When the value of the checks is rounded to the nearest $10, the sum is not close to $227.64.

329) You go to the bank to cash three checks. The checks are for $41.64, $133.35, and $94.24. You are given $269.23 by the teller. Estimate to see if the amount given you seems to be correct. Does $269.23 seem to be correct? Explain your answer.

Answer: Yes; When the value of the checks is rounded to the nearest $10, the sum is close to $269.23.

330) Explain in your own words the commutative law of addition.

Answer: Numbers can be added in any order and have the same sum.

331) For any division sentence there is a corresponding multiplication sentence. For example, for the division statement $12 \div 4 = 3$, the corresponding multiplication sentence is $3 \times 4 = 12$. Consider the division problem $8 \div 0$. What do you think the answer is to this division problem? Consider the corresponding multiplication sentence. What conclusion do you arrive at? Explain your answer.

Answer: There is no number that when multiplied by 0 will equal 8. Division by 0 is undefined for any real number.

332) Is division commutative? Explain your answer.

Answer: No. $a \div b$ does not always equal $b \div a$.

333) The expression $8 + (4 \div 2)$ contains parentheses. Are they necessary? Explain.

Answer: No. Without the parentheses the procedure would be the same. Division is done before addition. $8 + (4 \div 2) = 8 + 4 \div 2 = 10$.

334) The expression $(3 + 5) \div 2$ contains parentheses. Are they necessary? Explain.

Answer: Yes. Without the parentheses 5 would be divided by 2, then that answer would be added to 3. $(3 + 5) \div 2 = 4$ and $3 + 5 \div 2 = 5.5$.

MULTIPLE CHOICE. Choose the one alternative that best completes the statement or answers the question.

Determine if the second number is a factor of the first number.

332) No. $a \div b$ does not always equal $b \div a$.
333) No. Without the parentheses the procedure would be the same. Division is done before addition. $8 + (4 \div 2) = 8 + 4 \div 2 = 10$.
334) Yes. Without the parentheses 5 would be divided by 2, then that answer would be added to 3. $(3 + 5) \div 2 = 4$ and $3 + 5 \div 2 = 5.5$.
