   b. eight more than four times a number
   c. four less than the quotient of a number and twelve

4. Determine whether the given number is a solution of the equation.
   a. $x - 8 = 12$; 20 b. $4x - 7 = 9$; 3 c. $3(y-5) = 6$; 7

   b. The difference of twice a number and three is equal to twenty-seven.
   c. Six less than three times a number is the same as the number increased by twelve.

**Teaching Notes:**

- It may be helpful to draw students' attention to the word "evaluate." Help them see the letters v – a – l – u . This will help them remember that evaluate means to find the value of an expression.
- Students often make mistakes with the phrase "less than" so they should be cautioned about the order of the subtraction.
- Translating from English to algebra is an important skill that will be used often.

**2.** 5 divided by 3 is 1 with a remainder of 2, so $\frac{5}{3} = 1\frac{2}{3}$.

**3.** Begin by selecting any two numbers whose product is 36.
Here is one possibility: $36 = 4 \cdot 9$
Because the factors 4 and 9 are not prime, factor each of these composite numbers.
$36 = 4 \cdot 9$

$= 2 \cdot 2 \cdot 3 \cdot 3$

Notice that 2 and 3 are both prime. The prime factorization of 36 is $2 \cdot 2 \cdot 3 \cdot 3$.

**4. a.** $\frac{10}{15} = \frac{2 \cdot \cancel{5}}{3 \cdot \cancel{5}} = \frac{2}{3}$

**b.** $\frac{42}{24} = \frac{\cancel{2} \cdot \cancel{3} \cdot 7}{2 \cdot 2 \cdot \cancel{2} \cdot \cancel{3}} = \frac{7}{4}$

When reducing fractions, it may not be necessary to write prime factorizations. We can use the greatest common factor to reduce this fraction.

$\frac{42}{24} = \frac{7 \cdot \cancel{6}}{4 \cdot \cancel{6}} = \frac{7}{4}$

**c.** $\frac{13}{15}$; Because 13 and 15 share no common factors (other than 1), $\frac{13}{15}$ is already reduced to its lowest terms.
