Chapter 1 - Human Inquiry and Science			
ANSWER: a			
45. What statement best describes deductive approaches to a. Deductive begins with big things and moves toward	č		
b. Deductive begins at the bottom and moves toward the	e		
c. Deductive begins at a micro level and moves toward	l a macro level.		
d. Deductive begins with theoretical ideas and moves t	toward observable things.		

ANSWER: d

- 46. What statement best describes inductive approaches to social theory and research?
  - a. Inductive begins with specific observations and moves toward general ideas.
  - b. Inductive begins at the top and moves toward the bottom.
  - c. Inductive begins at the top of society and moves toward the bottom of society.
  - d. Inductive begins with small things and moves toward big things.

ANSWER: a

- 47. Your local newspaper reports a high-profile suicide. At age 14, a girl named Suzanne committed suicide after years of being bounced around several foster homes, drug addiction, and sexual exploitation. A public inquest was held in order to gain an understanding all of the circumstances surrounding Suzanne's death. What kind of explanation is presented to help us understand this case?
  - a. idiographicb. nomotheticc. probabilisticd. quantitative

ANSWER: a

- 48. At the outset of any study, every observation can potentially be which of the following?
  - a. quantifiableb. qualitativec. unmeasurabled. descriptive

ANSWER: b

- 49. What is one benefit of quantification?
  - a. It often makes our observations more implicit.
  - b. It can make it easier to aggregate data.
  - c. It can make it easier to collect data.
  - d. It helps add a richness to our understanding of the data.

ANSWER: b

- 50. When describing qualitative and quantitative explanations, what can we conclude?
  - a. Both types of explanations tend to be idiographic.
  - b. Both types of explanations tend to be nomothetic.
  - c. Qualitative explanations tend to be idiographic, and quantitative explanations tend to be nomothetic.
  - d. Qualitative explanations tend to be nomothetic, and quantitative explanations tend to be idiographic.

ANSWER: c

- 51. What does the statement "Knowledge for knowledge's sake" best describe?
  - a. pure research b. applied research

Name:	_ Class:	_ Date:
Chapter 1 - Human Inquiry and Science		

c. inductive logic d. deductive logic

ANSWER: a

52. Which one of these would be the MOST appropriate way to quantify the abstract concept of success?

a. how happy someone is in their job

b. whether a person has earned any awards

c. the likelihood of a person getting a raise

d. a person's feelings about their boss

ANSWER: b

- 53. To study the effectiveness of a new educational program, Emily designs an experiment to assess its success. She measures student ability before and after the program, to try to establish whether there has been an increase in ability that can be attributed to the new resource. What type of research has Emily designed?
  - a. pure research
- b. social impact assessment research
- c. applied research
- d. basic research

ANSWER: c

- 54. Among the following, which is the best example of pure research?
  - a. an evaluation of the effectiveness of a water sanitation program in reducing maternal mortality in Ghana
  - b. an experiment to test whether or not a new drug shrinks cancerous tumours
  - c. depictions of childbirth in nineteenth-century romance novels
  - d. a campus-wide survey of students' mental health needs during exams

ANSWER: c

- 55. Mixed methods researchers can do all of the following EXCEPT which one?
  - a. give priority to one form of data over another
  - b. use qualitative data
  - c. use quantitative data
  - d. rely on single viewpoints

ANSWER: d

- 56. Which of the following describes what is involved in triangulation?
  - a. different methods, observers, or data sources
  - b. different methods or observers but only for the same data source
  - c. different methods but the same observers and data source
  - d. different data sources or observers but only for the same methods

ANSWER: a

- 57. Which of the following is a distinction of the primary method of MMR notation?
  - a. using parentheses () around signs and symbols only
  - b. using a parallel sign (//) to indicate a concurrent/parallel design
  - c. using a plus sign (+) for sequential design
  - d. writing in upper case

ANSWER: d

58. Which MMR design type is depicted in the following sequence of steps? Qualitative data collection and analysis > Builds to > Quantitative data collection and analysis > Interpretation

Name:		Class:	Date:
Chapter 1 - Human Inquiry	and Science		
a. convergent parallel c. exploratory sequential ANSWER: c	b. explanatory sequential d. embedded	ial

#### Chapter 1 - Human Inquiry and Science

- 75. Pure research creates knowledge for knowledge's sake.
  - a. True
  - b. False

ANSWER: True

- 76. Non-scientific concerns shape the activities of social researchers.
  - a. True
  - b. False

ANSWER: True

- 77. How is causal inquiry influenced by our sources of knowledge? How can our conclusions be flawed as a result?
- ANSWER: Causal inquiry is aimed at predicting future events; it is a way by which humans ensure their survival. We often rely on tradition to help us make those predictions, such as knowing that exercise helps us live longer. Or we rely on physicians as authorities on what sorts of behaviours are healthy. Causal inquiry can be flawed when it is based on limited experiences, such as assuming that exercise won't help your longevity since your active grandparents died young. Something like tradition alone is not sufficient either, since there are many practices that are common but unhealthy. Tradition might tell us that hard work is a virtue—the Protestant work ethic—but it is not good for our health when we work to the point of constant exhaustion.
- 78. Explain what is meant by the statement "Both tradition and authority, then, are double-edged swords in the search for knowledge about the world."
- ANSWER: It means that both have their benefits and drawbacks, and they can both help and hinder inquiry. For example, authority figures can sometimes be wrong. If you ever had a high school teacher who gave you incorrect advice about biological facts, this will sound familiar to you. (For example, should you really put a spoon in the mouth of a person who is having a seizure? No, it is dangerous—but teachers have been known to say such things, especially when they are teaching other subjects like art.) When students are expected to accept what teachers say simply because they are teachers, inaccurate learning can ensue.
- 79. You are interested in knowing more about people who are known child abusers, and based on media accounts, you notice that people who are on trial for child abuse tend to have a higher than average likelihood of having been child abuse victims themselves. Discuss the extent to which we can use clinical or actual prediction in this instance, and why. *ANSWER:* In this case we would use clinical prediction, because by understanding the histories of child abusers, we are developing an understanding of the causal mechanisms of child abuse.
- 80. Discuss how scientific inquiry tries to avoid the common pitfalls that produce error in non-scientific inquiry.
- ANSWER: We can reduce error simply by making deliberate observations. While this might sound obvious at first, when you think about it, many things that we take for granted as true have not been carefully observed. For example, we might assume that crime is always on the increase, when in fact the murder rate has decreased over time in many places. Scientists are also careful not to overgeneralize, such as assuming that a brief spike in murders indicates a long-term trend. A prominent case of homicide by a stranger likewise does not prove the theory that murders tend to be at the hands of strangers, and scientists try to track the source of murders overall rather than selectively observe a prominent case while ignoring the fact that most victims were known to the murderer.
- 81. While on vacation, during a stopover in Panama, I noticed that most of the wait staff I encountered were of Asian descent. I thus concluded that most individuals who work as waiters/waitresses in Panama are Asian. Is my conclusion justified? Why or why not?
- ANSWER: It is an instance of overgeneralization, which is unjustified because you have not compared the variety of wait staff you encountered to the wait staff that others have encountered. Perhaps Asians are actually a small

Name: C	class:	Date:
---------	--------	-------

#### Chapter 1 - Human Inquiry and Science

proportion of wait staff. You have based your conclusion on your rather limited personal experience.

82. Your friend Joshua tells you the tragic story regarding his proximate family and airplane rides. His grandfather underwent an emergency landing in the Ottawa River following an impact with a bird during takeoff. His cousin Vince died in an Air Canada flight that suffered mechanical failures while flying over Mexico. His brother broke his arm while foolishly attempting to fit into an airplane bathroom with his girlfriend last year. His mother's plane experienced engine failure during a transatlantic flight to Spain.

Despite his family's unfortunate past with airplanes, Joshua feels no worries when flying. He explains this by saying that since so many members of his family have already experienced flight incidents, which are statistically rare, the chances of him personally experiencing a flight disturbance are much lower than those of the average person. Is Joshua's conclusion justified? Why or why not?

- ANSWER: No, but only because he feels that his risk is lower; probabilistically speaking we have no reason to believe his should be any lower. It uses illogical reasoning to assume that independent events can impact other independent events. Only magic or supernatural forces could make that occur, and scientists rely on reason.
- 83. Discuss how the scientific method is an approach to correcting inaccuracies of ordinary human inquiry.
- ANSWER: Ordinary inquiry tends to be based upon personal experiences. But those experiences are only a partial reflection of reality, and may differ from other people's experiences. For example, we might assume that finishing a university degree won't make a difference in the job market because a sibling hasn't had as much career success after graduation as they had hoped. But if we were to look at overall patterns, we would find that in the long run, a university degree increases chances of establishing a career. It may not guarantee success in everyone's case, but based on larger numbers of people we know that it improves the probability of success.
- 84. Your family is horrified at your announcement that you plan to get married to a person whom you have been dating for just six weeks. You reason with them that your aunt and uncle married after a whirlwind courtship as well, and they recently celebrated their Golden Wedding anniversary. What is the problem with your reasoning?
- ANSWER: Exceptions do not invalidate general patterns (social regularities). Generally speaking, marriages in which partners have not known each other for very long rarely last. This is not a guarantee that your marriage will fail, but probabilistically speaking, its chances of success are not good.
- 85. On your most recent Research Methods exam, your professor gave you the following question: "Pretend that you are going to conduct a study of the relationship between socioeconomic status and happiness. Please identify the attributes of these two variables." In your answer, you provide detailed descriptions, such as "Happiness can mean different things to different people, but generally it refers to a positive state of well-being. Socioeconomic status can include a variety of attributes, such as one's education and income." *Explain why you would fail this test question*.
- ANSWER: In the language of variables, attributes are the specific scores on a variable, so that put together, they make up that variable. Think about them in terms of measurement rather than conceptual meaning. Socioeconomic status may have attributes such as lower, medium, and higher. Happiness may include attributes such as not at all happy, somewhat happy, and very happy.
- 86. List five sociological variables and their attributes.
- ANSWER: Answers may vary. Examples might include: 1. Age (18, 19, 20, etc.); 2. Educational Level (Less than High School, High School Diploma, Some Postsecondary, Complete Postsecondary); 3. Marital Status (Never Married, Married, Separated, Widowed, Divorced); 4. Sex (Male, Female); 5. Home Ownership (Own, Rent).
- 87. Explain the difference between idiographic and nomothetic explanations. Which type is associated with quantitative research and which is associated with qualitative research?
- ANSWER: Idiographic explanations try to exhaust all possible reasons for a single event, such as the reason that a young Copyright Cengage Learning. Powered by Cognero.

  Page 12

Name: Class: Date:	
--------------------	--

#### Chapter 1 - Human Inquiry and Science

man was murdered. Nomothetic explanations try to explain a broad category of events, such as the factors that place young men at risk of being murdered, such as age and involvement in the drug trade. Nomothetic explanations tend to be associated with quantitative research, since it involves comparing a variety of cases for common variables. Idiographic explanations tend to be qualitative, since the researcher needs to delve deeply into the specific details of the case.

- 88. A non-profit child welfare organization is evaluating two competing research proposals in order to decide which one will get grant money to carry out their project. Both proposals are of high quality and are being seriously considered for funding; they merely differ in approach. One proposal is to examine the case of a young boy who died of a sudden illness while in foster care, in order to determine the boy's family history, his health history, the characteristics of the foster family, monitoring of his care by authorities, and so on. The other study wants to examine all available case records of children who died while in foster care in order to identify factors that they had in common, such as the number of children in the home, whether or not the children tended to have existing health issues, and so on. Which types of explanation are involved in each study? Explain your answer.
- ANSWER: The first study is idiographic because it is trying to understand all of the circumstances of this particular case in which a boy died. Such research often points to the need for future research to see if there are common factors in similar cases. The second study is nomothetic, in that it is trying to identify a set of common factors that each case of child death has in common, through a larger sample of similar cases.
- 89. How do qualitative and quantitative approaches differ in terms of skills and procedures? State the main distinction between the two, and how you might research the same topic from each approach.
- ANSWER: Qualitative researchers are skilled at listening and taking notes that reflect their subject's point of view, and they tend to observe smaller samples of people. They carefully analyze these notes to look for general patterns. A quantitative researcher's strengths lie in making broad statements based upon specific questions posed to larger numbers of people. They are skilled statisticians. If we want to measure attitudes toward immigration, a qualitative researcher might conduct a focus group in which members have a conversation about immigration. The researcher looks for patterns of statements. A quantitative researcher would likely conduct a survey of a larger sample and look for statistical patterns of response, such as the percentage of respondents who favour increased immigration levels and whether those percentages differed by age.
- 90. Suppose that a research team wanted to use official records to test the labelling theory of crime, in other words that deeming a person a "criminal" in fact encourages them to continue with criminal behaviour. They looked at records of first-time offenders who were convicted for petty crimes (giving them a criminal record) compared to those who were given leniency by the courts (no criminal record), to see whether or not the first group were convicted of more serious crimes within the following five years. Would they be using an inductive or a deductive approach? Explain your answer.
- ANSWER: In this case they would be using a deductive approach because they are beginning with a general theory (labelling) and testing it in a specific situation (criminal records.) Inductive research does not generally begin with a theory, but instead develops a general theory based on specific observations.
- 91. You decide to survey group of university students about their stress levels at the start of the term and then again at the end of the term. You hope that making at least two measurements will enhance your understanding of the dynamics of academic stress. Explain why you would or would not call this a mixed methods approach.
- ANSWER: Mixed methods approaches combine at least one different qualitative and quantitative method to gain a deeper understanding of an issue. If you had combined one or more surveys with focus groups about stress, you would have a mixed methods approach.
- 92. What is triangulation? When would you use it?
- ANSWER: Triangulation refers to an emphasis on using different methods, data sources, or observers to measure and understand a phenomenon. The logic is that we enhance validity when we examine an issue from different vantage points. For example, if you wanted to research campus protests about racism, you might interview

Name:	Class:	Date:
-------	--------	-------

#### Chapter 1 - Human Inquiry and Science

members of the student body as well as members of the administration to gain an understanding of how both groups view the issue. They might view it similarly in some ways, or differently in other ways, but you would get only a partial view of the issue if you interviewed just one group or the other.

93. What are the strengths of mixed methods research?

ANSWER: Mixed methods research offsets the disadvantages of any particular method. No method (or type of informant) is perfect, nor can it answer most questions as richly as we would like. A survey or interview can help give us a general sense of the extent to which crime is a serious concern for members of a community. But they won't give us the same picture of crime as if we were to survey or interview local law enforcement, who might see crime from a different perspective because they not only are on the front lines every day but also are responsible for tracking crime patterns. By measuring both types of informant, we are mixing methods to get a fuller picture of the issues involved.

94. What are the strengths of using different types of informants in MMR?

ANSWER: Mixed methods research offsets the disadvantages of any particular method. Different types of informant might see issues differently, just as you might view your family dynamics differently than your parents do. For example, a survey or interview can help give us a general sense of the extent to which crime is a serious concern for members of a community. But they won't give us the same picture of crime as if we were to survey or interview local law enforcement, who might see crime from a different perspective because they not only are on the front lines every day but also are responsible for tracking crime patterns. By measuring both types of informant, we are mixing methods to get a fuller picture of the issues involved.

95. What are the differences between explanatory and exploratory sequential MMR designs?

ANSWER: Explanatory sequential designs begin with quantitative data collection and analysis, and follow up with qualitative data collection and analysis and final interpretation. In that sense the word "explain" makes sense because qualitative data can add richness and context to further illuminate and interpret quantitative results. Exploratory sequential designs do the opposite, in that they begin with qualitative data, which can help inform their survey design process rather than going in blind per se. Exploratory designs are particularly useful for topics that are not yet well understood, so we don't have standard survey items to measure them. Qualitative methods are one way of developing those tools of quantitative measurement by revealing which dimensions of a topic are important to consider.
