## Chapter 01 - Limits, Alternatives, and Choices

McConnell Brue Flynn, Barbiero Macro 15ce

### DISCUSSION QUESTIONS

1. What is an opportunity cost? How does the idea relate to the definition of economics? Which of the following decisions would entail the greater opportunity cost: Allocating a square block in the heart of Toronto for a surface parking lot or allocating a square block at the edge of a typical suburb for such a lot? Explain. **LO1.2**

**Answer:** An opportunity cost is what was sacrificed to do or acquire something else. The condition of scarcity creates opportunity cost. If there was no scarcity, there would be no need to sacrifice one thing to acquire another.

The opportunity cost would be much higher in Toronto as the alternative uses for that square block are much more valuable than for a typical suburban city block.

2. Cite three examples of recent decisions that you made in which you, at least implicitly, weighed marginal cost and marginal benefit. **LO1.2**

**Answer:** Student answers will vary, but may include the decision to come to class, to skip breakfast to get a few extra minutes of sleep, to attend college, or to make a purchase. Marginal benefits of attending class may include the acquisition of knowledge, participation in discussion, and better preparation for an upcoming examination. Marginal costs may include lost opportunities for sleep, meals, or studying for other classes. In evaluating the discussion of marginal benefits and marginal costs, be careful to watch for sunk costs offered as a rationale for marginal decisions.

3. What is meant by the term “utility” and how does the idea relate to purposeful behaviour? **LO1.2**

**Answer:** “Utility” refers to the pleasure, happiness, or satisfaction gained from engaging in an activity (eating a meal, attending a ball game, etc.). It is an important component of purposeful behaviour because people will allocate their scarce time, energy, and money in an attempt to gain the most utility possible.

4. What are the key elements of the scientific method and how does this method relate to economic principles and laws? **LO1.3**

**Answer:** The key elements include the gathering of data (observation), the formulation of possible explanations (hypothesis), testing the hypothesis, determining the validity of the hypothesis, and repeated testing of hypotheses that have appeared to be valid in prior tests. The scientific method is the technique used by economists to determine economic laws or principles. These laws or principles are formulated to explain and/or predict behavior of individuals or institutions.

Chapter 01 - Limits, Alternatives, and Choices

5. State (a) a positive economic statement of your choice, and then (b) a normative economic statement relating to your first statement. **LO1.4**

**Answer:** Student answers will vary. Example: (a) The unemployment rate is 6.8 percent; (b) the unemployment rate is too high. In general, we treat “what is” statements as positive, “what should be” as normative, but keep an eye out for statements like “at full employment an increase in the production of pizzas *should* come at the cost of less robots.” Some students may incorrectly identify the statement as normative because of the term “should.”

6. How does the slope of a budget line illustrate opportunity cost and trade-offs? How does a budget line illustrate scarcity and the effect of limited incomes? **LO1.5**

**Answer:** Budget lines are always sloped downward. This downward slope shows an inverse relationship between the two goods, meaning that as you increase one, the other must decrease. This decrease is what you are giving up, or opportunity cost, of the good you are getting more of.

Budget lines illustrate scarcity in that they show you are limited by your income. Since they slope downward, they show you cannot keep getting more and more of both goods. There is always a trade-off. The area beyond the budget line represents combinations of the goods that are beyond your income.

7. What are economic resources? What categories do economists use to classify them? Why are resources also called factors of production? Why are they called inputs? **LO1.6**

**Answer:** Economic resources are the natural, human, and manufactured inputs used to produce goods and services. Economic resources fall into four main categories: labour, land (natural resources), real capital (machines, factories, buildings, etc.,) and entrepreneurs. Economic resources are also called *factors of production* because they are used to *produce* goods and services. They are called *inputs* because they go *in* to a production process (like ingredients go into a bowl to make a cake), with the resulting goods and services also being referred to as *output*.

8. Why is money not considered to be a capital resource in economics? Why is entrepreneurial ability considered a category of economic resource, distinct from labour? What are the major functions of the entrepreneur? **LO1.6**

**Answer:** Money is not considered a capital resource because money is not productive – it provides access to resources but itself does not directly contribute to the production of goods and services. Additionally, the quantity of money in circulation does not determine an economy’s productive capacity, while the amount of capital and other resources does. Doubling the amount of money in circulation does not change the economy’s physical capacity to produce goods and services. Money is, however, referred to as a *financial resource* and *financial capital*, reflecting its ability to acquire real economic resources.

Entrepreneurial ability and labour are both human resources, but they perform different functions in the productive process. Entrepreneurial ability does not directly produce

Chapter 01 - Limits, Alternatives, and Choices

goods and services; it organizes the resources that do. Labour refers to the human inputs that directly engage in production.

Entrepreneurs are risk-takers: They coordinate the activities of the other three inputs for profit—or loss, which is why they are called risk-takers. Entrepreneurs sometimes manage companies that they own, but a manager who is not an owner is not necessarily an entrepreneur but may be performing some of the entrepreneurial functions for the company. Entrepreneurs are also innovators, or perhaps inventors, and profits help to motivate such activities.

9. Specify and explain the typical shapes of marginal-benefit and marginal-cost curves. How are these curves used to determine the optimal allocation of resources to a particular product? If current output is such that marginal cost exceeds marginal benefit, should more or fewer resources be allocated to this product? Explain. **LO1.7**

**Answer:** The marginal benefit curve is downward sloping; MB falls as more of a product is consumed because additional units of a good yield less satisfaction than previous units. The marginal cost curve is upward sloping, MC increases as more of a product is produced since additional units require the use of increasingly unsuitable resource. The optimal amount of a particular product occurs where MB equals MC. If MC exceeds MB, fewer resources should be allocated to this use, as the additional cost is more than the additional benefit.

10. Suppose that, on the basis of a nation's production possibilities curve, an economy must sacrifice 10,000 pizzas domestically to get the 1 additional industrial robot it desires but that it can get the robot from another country in exchange for 9,000 pizzas. Relate this information to the following statement:

“Through international specialization and trade, a nation can reduce its opportunity cost of obtaining goods and thus ‘move outside its production possibilities curve.’” **LO1.8**

**Answer:** The message of the production possibilities curve is that an individual nation is limited to the combinations of output indicated by its production possibilities curve. International specialization means directing domestic resources to output which a nation is highly efficient at producing. International trade involves the exchange of these goods for goods produced abroad. Specialization and trade have the same effect as having more and better resources or discovering improved production techniques. The output gains from greater international specialization and trade are the equivalent of economic growth.

Chapter 01 - Limits, Alternatives, and Choices

**The LAST WORD** Studies indicate that married men on average earn more income than unmarried men of the same age and education level. Why must we be cautious in concluding that marriage is the cause and higher income is the effect?

**Answer:** Correlation does not necessarily mean that there is causation. The relationship could be purely coincidental or dependent on some other factor not included in the analysis. It is also possible that higher income is the variable that “causes” marriage.

**REVIEW QUESTIONS**

1. Match each term with the correct definition. **LO1.2**

economics  
opportunity cost  
marginal analysis  
utility

- a. The next-best thing that must be foregone in order to produce one more unit of a given product.
- b. The pleasure, happiness, or satisfaction obtained from consuming a good or service.
- c. The social science concerned with how individuals, institutions, and society make optimal (best) choices under conditions of scarcity.
- d. Making choices based on comparing marginal benefits with marginal costs.

**Answer:** a. opportunity cost; b. utility; c. economics; d. marginal analysis

2. Indicate whether each of the following statements applies to microeconomics or macroeconomics: **LO1.4**

- a. The unemployment rate in Canada was 5.9 percent in January 2018.
- b. A software firm discharged 15 workers last month and transferred the work to India.
- c. An unexpected freeze in central Florida reduced the citrus crop and caused the price of oranges to rise.
- d. Canadian output, adjusted for inflation, increased by 3.0 percent in 2017.
- e. Last week ScotiaBank lowered its interest rate on business loans by one-half of 1 percentage point.
- f. The consumer price index rose by 1.7 percent from January 2017 to January 2018.

**Answer:** a. macro; b. micro; c. micro; d. macro; e. micro; f. macro

Chapter 01 - Limits, Alternatives, and Choices

3. Suppose that you initially have \$100 to spend on books or movie tickets. The books start off costing \$25 each and the movie tickets start off costing \$10 each. For each of the following situations, would the attainable set of combinations that you can afford increase or decrease?

**LO1.5**

- Your budget increases from \$100 to \$150 while the prices stay the same.
- Your budget remains \$100, the price of books remains \$25, but the price of movie tickets rises to \$20.
- Your budget remains \$100, the price of movie tickets remains \$10, but the price of a book falls to \$15.

**Answer:**

- increase** because a larger budget allows you to purchase not only the combinations that you could afford before but also new combinations that you could not afford before (for example, you can now afford to purchase 4 books and 5 movie tickets);
- decrease** because certain combinations are no longer affordable (for example, you can no longer purchase 10 movie tickets with your \$100 budget);
- increase** because the lower price allows you to purchase combinations that you could not afford before (for example, you can now purchase 6 books and 1 movie ticket)].

4. Suppose that you are given a \$100 budget at work that can be spent only on two items: staplers and pens. If staplers cost \$10 each and pens cost \$2.50 each, then the opportunity cost of purchasing one stapler is: **LO1.5**

- 10 pens.
- 5 pens.
- zero pens.
- 4 pens.

**Answer: 4 pens.** You must forego purchasing 4 pens if you are to free up enough money ( $4 \times \$2.50 = \$10$ ) to purchase a stapler.

5. For each of the following situations involving marginal cost (MC) and marginal benefit (MB), indicate whether it would be best to produce more, fewer, or the current number of units. **LO1.5**

- 3,000 units at which  $MC = \$10$  and  $MB = \$13$ .
- 11 units at which  $MC = \$4$  and  $MB = \$3$ .
- 43,277 units at which  $MC = \$99$  and  $MB = \$99$ .
- 82 units at which  $MC < MB$ .
- 5 units at which  $MB < MC$ .

**Answer:**

- more** because  $MB > MC$  -- the benefit of consuming one more unit exceed the opportunity costs (scarce resources used elsewhere) of producing that additional unit.
- fewer** because  $MC > MB$  -- the opportunity costs (scarce resources used elsewhere) of producing one more unit exceed the benefit of consuming that additional unit.
- current amount** because  $MB = MC$  -- there is no net gain in using scarce resources in producing and consuming one more unit.
- more** because  $MB > MC$  -- *see the explanation for part (a)*
- fewer** because  $MB < MC$  -- *see the explanation for part (b)*

Chapter 01 - Limits, Alternatives, and Choices

6. Explain how (if at all) each of the following events affects the location of a country's production possibilities curve: **LO1.7**

- a. The quality of education increases.
- b. The number of unemployed workers increases.
- c. A new technique improves the efficiency of extracting copper from ore.
- d. A devastating earthquake destroys numerous production facilities.

**Answer:**

- a. Assuming better education translates into better work skills, then productivity should rise and this would shift the curve outward.
- b. Should not affect location of curve. Production moves inward, away from the curve.
- c. The curve should shift outward as more production is possible with existing resources.
- d. The curve should shift inward with the destruction of resources (capital).

7. What are the two major ways in which an economy can grow and push out its production possibilities curve? **LO1.8**

- a. Better weather and nicer cars.
- b. Higher taxes and lower spending.
- c. Increases in resource supplies and advances in technology.
- d. Decreases in scarcity and advances in auditing.

**Answer:**

- c. The economy produces output from resource inputs like land, labour, and capital. So one major way for an economy to grow and push out its production possibilities curve is for it to *obtain more resources*.  
The second major way is to *develop new and better technologies* so that the economy can produce more from any given amount of resources.

**PROBLEMS**

1. Potatoes cost Janice \$1 per kilogram, and she has \$5.00 that she could possibly spend on potatoes or other items. If she feels that the first kilogram of potatoes is worth \$1.50, the second kilogram is worth \$1.14, the third kilogram is worth \$1.05, and all subsequent kilograms are worth \$0.30, how many kilograms of potatoes will she purchase? What if she only had \$2 to spend? **LO1.2**

**Answer: 3; 2**

**Feedback:** Janice will purchase potatoes until the value of potatoes is less than the cost of potatoes or until her income has been exhausted. For example, assume Janice has \$5.00 to spend on potatoes or other items and the cost of a kilogram of potatoes is \$1. Now assume the first kilogram of potatoes is worth \$1.50 to Janice. She will purchase this kilogram of potatoes since the value of the kilogram of potatoes (\$1.50) is greater than the cost (\$1). If the second kilogram is worth \$1.14 and the third kilogram is worth a \$1.05 then Janice will purchase these as well since the value exceeds the cost of \$1. If all remaining kilograms are worth \$0.30 then Janice will not purchase these because the value is less than the cost. So, Janice will purchase 3 kilograms of potatoes at total cost of \$3.00.

Now assume Janice only has \$2.00 to spend on potatoes. She will purchase the first kilogram because it is worth \$1.50 to her and it only costs a \$1. She will purchase the second kilogram because it is worth \$1.14. She has now spent her entire income on potatoes. She would like to purchase the third kilogram because the value of this kilogram of potatoes is \$1.05, but she does not have the income to make this purchase. So, Janice will purchase 2 kilograms of potatoes at a total cost of \$2.00.

2. Pham can work as many or as few hours as she wants at the university bookstore for \$9 per hour. But due to her hectic schedule, she has just 15 hours per week that she can spend working at either the bookstore or at other potential jobs. One potential job, at a café, will pay her \$12 per hour for up to 6 hours per week. She has another job offer at a garage that will pay her \$10 an hour for up to 5 hours per week. And she has a potential job at a daycare center that will pay her \$8.50 per hour for as many hours as she can work. If her goal is to maximize the amount of money she can make each week, how many hours will she work at the bookstore? **LO1.2**

**Answer: 4.**

**Feedback:** Pham will choose to work at the bookstore as long as the wage rate at the bookstore exceeds her other opportunities. However, if another job offers a higher wage rate she will choose employment there. She will work until her total time allotment (for work) is exhausted.

For example, assume Pham only has 15 hours per week that she can work and the wage rate at the bookstore is \$9 per hour. She can also spend her time working at a café that will pay her \$12 per hour for up to 6 hours per week, at a garage that will pay her \$10 an hour for up to 5 hours per week, and at a daycare center that will pay her \$8.50 per hour for as many hours as she can work.

She will choose to work at the café for the full 6 hours because the wage rate at the café is \$12 per hour, which is greater than the wage rate at the bookstore of \$9. This leaves her with 9 hours of work time remaining. Next, she will choose to work at the garage for the full 5 hours because the wage rate here is \$10, which again is greater than the bookstore wage rate \$9. After this decision she only has 4 hours of work time remaining. She will choose to work these last 4 hours at the bookstore because the bookstore wage rate of \$9 exceeds the daycare center wage rate of \$8.50.

Chapter 01 - Limits, Alternatives, and Choices

3. Suppose you won \$15 on a lotto ticket at the local 7-Eleven and decided to spend all the winnings on candy bars and bags of peanuts. Candy bars cost \$0.75 each while bags of peanuts cost \$1.50 each. **LO1.6**

- Construct a table showing the alternative combinations of the two products that are available.
- Plot the data in your table as a budget line in a graph. What is the slope of the budget line? What is the opportunity cost of one more candy bar? Of one more bag of peanuts? Do these opportunity costs rise, fall, or remain constant as additional units are purchased?
- Does the budget line tell you which of the available combinations of candy bars and bags of peanuts to buy?
- Suppose that you had won \$30 on your ticket, not \$15. Show the \$30 budget line in your diagram. Has the number of available combinations increased or decreased?

**Answers:**

**Part a:**

Consumption alternatives

| Goods           | A  | B | C | D  | E  | F  |
|-----------------|----|---|---|----|----|----|
| Candy bars      | 0  | 4 | 8 | 12 | 16 | 20 |
| Bags of peanuts | 10 | 8 | 6 | 4  | 2  | 0  |

**Part b:**

Chapter 01 - Limits, Alternatives, and Choices

**Feedback:** The slope for the budget line above, with candy bars on the horizontal axis, is  $-0.5 (= -P_{cb}/P_{bp})$ . Note that the figure could also be drawn with bags of peanuts on the horizontal axis. The slope of that budget line would be  $-2$ .

The opportunity cost of one more candy bar is  $\frac{1}{2}$  of a bag of peanuts. The opportunity cost of one more bag of peanuts is 2 candy bars. These opportunity costs are constant. They can be found by comparing any two of the consumption alternatives for the two goods.

**Part c: No; it only tells you what is possible.**

**Feedback:** The budget line does not tell you which of the available combinations of candy bars and bags of peanuts to buy. You will need to use your preference relationship for candy bars and bags of peanuts to determine which combination to buy. The budget line only tells you which combinations are feasible.

**Part d: Increased.**

**Feedback:** The budget line at \$30 would be preferable because it would allow greater consumption of both goods.

Chapter 01 - Limits, Alternatives, and Choices

4. Suppose that you are on a desert island and possess exactly 20 coconuts. Your neighbour, Friday, is a fisherman, and he is willing to trade 2 fish for every 1 coconut that you are willing to give him. Another neighbor, Kwame, is also a fisherman, and he is willing to trade 3 fish for every 1 coconut.

**LO1.6**

- On a single figure, draw budget lines for trading with Friday and for trading with Kwame. (Put coconuts on the vertical axis.)
- What is the slope of the budget line from trading with Friday?
- What is the slope of the budget line from trading with Kwame?
- Which budget line features a larger set of attainable combinations of coconuts and fish?
- If you are going to trade coconuts for fish, would you rather trade with Friday or Kwame?

**Answers:**

**Part a:**

**Part b:  $-1/2$**

**Feedback:** The slope of the budget line from trading with Friday equals  $-(1/2)$ . This implies that for every coconut I give up, Friday must give up two fish. Or, for every fish that Friday gives up, I must give up  $(1/2)$  a coconut.

**Part c: -1/3**

**Feedback:** The slope of the budget line from trading with Kwame equals  $-(1/3)$ . This implies that for every coconut I give up, Kwame must give up three fish. Or, for every fish that Friday gives up, I must give up  $(1/3)$  a coconut.

**Part d: The budget line from trading with Kwame**

**Feedback:** The budget line from trading with Kwame features a larger set of attainable combinations of coconuts and fish. Because Kwame is willing to give up more fish per coconut, I can consume more of both (assuming I make a trade). This implies that you would prefer to trade with Kwame.

**Part e: Kwame**

**Feedback:** Because Kwame is willing to give up more fish per coconut, I can consume more of both (assuming I make a trade). This implies that you would prefer to trade with Kwame.

5. Below is a production possibilities table for consumer goods (automobiles) and capital goods (forklifts):

**LO1.6**

- Show these data graphically. Upon what specific assumptions is this production possibilities curve based?
- If the economy is at point C, what is the cost of one more automobile? Of one more forklift? Which characteristic of the production possibilities curve reflects the law of increasing opportunity costs: its shape or its length?
- If the economy characterized by this production possibilities table and curve were producing 3 automobiles and 20 fork lifts, what could you conclude about its use of its available resources?
- Is production at a point outside the production possibilities curve currently possible? Could a future advance in technology allow production beyond the current production possibilities curve? Could international trade allow a country to consume beyond its current production possibilities curve?

| Type of Production | Production Alternatives |    |    |    |   |
|--------------------|-------------------------|----|----|----|---|
|                    | A                       | B  | C  | D  | E |
| Automobiles        | 0                       | 2  | 4  | 6  | 8 |
| Forklifts          | 30                      | 27 | 21 | 12 | 0 |

**Answers:**

**Part a:** (See figure below.) The assumptions are full employment, fixed supplies of resources, fixed technology and two goods.

**Part b: 4 automobiles and 21 forklifts; its shape.**

**Feedback:** Consider the following example:

| Type of Production | Production Alternatives |    |    |    |   |
|--------------------|-------------------------|----|----|----|---|
|                    | A                       | B  | C  | D  | E |
| Automobiles        | 0                       | 2  | 4  | 6  | 8 |
| Forklifts          | 30                      | 27 | 21 | 12 | 0 |

Assume the economy is producing at point C. Thus, the economy is producing 4 automobiles and 21 forklifts.

The cost of producing one more automobile can be found by moving to point D and calculating the number of forklifts given up for the 2 additional automobiles. At point D the economy is producing 12 forklifts, which is a loss of 9 forklifts (moving from C to D) for the 2 additional automobiles. Thus the cost of 1 more automobile equals 9 (forklifts) divided by 2 (automobiles), or  $(9/2) = 4.5$  forklifts.

The cost of producing one more forklift can be found in an equivalent fashion. First, we will move to point B (from point C). Here we must give up 2 automobiles to get 6 forklifts. Thus, the cost of 1 more forklift equals 2 (automobiles) divided by 6 (forklifts), which is  $(2/6) = (1/3)$ .

Chapter 01 - Limits, Alternatives, and Choices

In review, take the cost (loss) and divide by the gain. If we were at point D, the cost of one more forklift equals 2 automobiles (loss) divided by 9 forklifts (gain). Thus, the cost of 1 more forklift at point B is  $(2/9)$  automobiles.

Increasing opportunity cost implies that we must give up more of a particular good to get an additional unit of a different good. This implies as we move along the production possibilities curve (from left to right) I must give up more automobiles to get an additional forklift. Thus, the SHAPE of the schedule captures the increasing opportunity cost concept.

**Part c: Underutilizing.**

**Feedback:** The economy is underutilizing resources (inside the PPC).

**Part d: No; Yes; Yes.**

**Feedback:** No, the country cannot produce outside its PPC. Yes, a technological advance would shift the PPC outward allowing the country produce more with a given amount of inputs. Yes, by specializing in goods we have a comparative advantage producing we can trade to gain access to goods beyond our own PPC.

6. Look at Figure 1.3. Suppose that the cost of cheese falls, so that the marginal cost of producing pizza decreases. Will the MC curve shift up or down? Will the optimal amount of pizza increase or decrease? **LO1.7**

**Answers: MC will shift down; the optimal amount of pizza will increase.**

**Feedback:** To think about cost schedules we must think about input costs. If the cost of cheese falls, then the cost of making pizza is cheaper for all pizzas. This implies that the marginal cost schedule will shift down reflecting the lower input cost. For a given demand schedule, the optimal amount of pizza produced and sold will increase and the equilibrium price would fall. The opposite story would apply if the cost of cheese were to increase.

7. Referring to the table in problem 5, suppose improvement occurs in the technology of producing forklifts but not in the technology of producing automobiles. Draw the new production possibilities curve. Now assume that a technological advance occurs in producing automobiles but not in producing forklifts. Draw the new production possibilities curve. Now draw a production possibilities curve that reflects technological improvement in the production of both goods. **LO1.8**

**Answers: See figures.**

**Technological advance in producing forklifts and not automobiles.**

**Feedback:** This implies we can produce more forklifts with the given resources, so the schedule will shift out along the horizontal axis.

Chapter 01 - Limits, Alternatives, and Choices

**Technological advance in producing automobiles and not forklifts.**

**Feedback:** This implies we can produce more automobiles with the given resources, so the schedule will shift up along the vertical axis.

**Technological in advance in producing automobiles and forklifts.**

Chapter 01 - Limits, Alternatives, and Choices

**Feedback:** This implies we can produce more forklifts and automobiles with the given resources, so the schedule will shift up out along the vertical and horizontal axes.

8. Because investment and capital goods are paid for with savings, higher savings rates reflect a decision to consume fewer goods for the present in order to be able to invest in more goods for the future. On average, households in China save 40 percent of their annual income each year, whereas households in Canada save less than 5 percent. Production possibilities are growing at roughly 9 percent annually in China and 3.5 percent in Canada. Use graphical analysis of “present goods” versus “future goods” to explain the differences in growth rates. **LO1.8**

**Answers: See figures below**

Chapter 01 - Limits, Alternatives, and Choices

**Feedback:** Since Canada is consuming more today rather than saving, their production possibilities curve will shift out slower (less) over time because they are accumulating less capital. China's production possibilities curve will shift out faster (more) over time because they are accumulating more capital.

# Chapter 1

## Introduction to Canadian Payroll

---

***LO1 Determine if an organization is an employer or has contracted for services***

---

The first learning objective relates to identifying whether there is a contract of employment between the worker and employer or whether the relationship is a contract for service. Students are required to understand that if a contract of employment is deemed to exist then there are significant liabilities for the employer to with-hold and remit statutory deductions, as well as pay workers compensation insurance premiums and possibly health taxes on the employment income.

If there is a contract for service then the employer is simply responsible for paying the worker based on invoiced amounts, inclusive of sales taxes. The worker is responsible for remitting any amounts due to government agencies dependant on whether they are self-employed or working for a corporation providing the contracted services.

It should be stressed that the Canada Revenue Agency and workers' compensation boards look at the substance of the agreement and not simply the contract. The Agency publishes a document to explain how to interpret a particular situation in RC4110. The key subjective test to be applied are:

Step 1 is to determine the intent of the worker and payer was at the commencement of the working agreement, whether employment and therefore a Contract of Service, or a business relationship which would be known as of Contract for Services.

Step 2 is to evaluate the essential nature of the working relationship based on the following fact

1. The degree of control that the payer exerts over the performance of the worker is considered. If the worker performs the job function without supervision or direction that would be appropriate for an employee, then it would be indicative that they are self-employed. On the other hand, if they follow prescribed hours of work, are supervised by the employer and the rate of pay is set unilaterally by the employer then this situation would indicate an employee/ employer relationship. A key element to consider is whether the payer has the rights to exercise control over the worker's activities, whether or not the right is enforced on the jobsite.

2. The provision and ownership of tools used by the worker is also used as a test. If the worker owns most of the equipment that they use and are responsible for the repair, maintenance and insurance of these tools it is an indication of self – employment. If most of the tools are provided by the payer who accepts risk of the ownership, then an employer/employee relationship is evident.
3. Another indicator to be considered is if the worker has the option to hire assistants or to sub-contract work to other workers. If they can independently make this decision, then it would be an indication of self-employment. If the payer makes all decision on hiring assistants or other workers, then it is an indication that the worker is an employee.
4. The degree of personal financial risk that the worker bears in performing the work is an indicator in that a self-employed person typically has expenses or other financial risk in performing the work. Examples may be the cost of carrying liability insurance or have fixed costs not reimbursed by the payer.
5. If the worker has responsibility for investment in business premises or activities to do the work, then it indicates they are self-employed. This would be further evidenced if the worker had the responsibility for managing and compensating employees directly.
6. If a worker has an opportunity for additional profit or chance of reduced profit from the contract, then there is evidence of self-employment. If the payer however pays for services performed at a fixed rate per unit of time or production and reimburses the worker for any expenses paid on behalf of the payer, then the situation is indicative of an employer/employee relationship.
7. The worker's degree of integration in the operations of the payer is also a consideration. If the worker acts and behaves as an employee, then they will be assumed to be an employee. However, if they demonstrate independence of decision making and use of personal resources then this may be indicative of self-employment.

For employees in Quebec we would use the following criteria based on the guidelines of Revenue Quebec:

To evaluate the contract in Quebec there are three steps involved:

1. Examine the intent of worker and payer on entering the contract through review of any documents and/or discussion with the parties.
2. Determine if the employment meets the definition of contract of employment based on the following factors:
  - The performance of the work must be performed by the individual.
  - The method of calculation of remuneration.
  - Relationship of subordination, which looks at the degree of control or autonomy of the worker compared to the payer's right to exercise control over the worker.
3. Compare the intentions of the parties to the contract to the actual working relationship to determine the status of the contract.

It is suggested in discussing the two sets of criteria to point out that each essentially looks at the contract similarly and will arrive typically at the same conclusion.

## ***LO2 The use of the Social Insurance Number***

---

The use of the Social Insurance Number is a straight forward section of the chapter but students may be intrigued by the reference to a “check digit” to validate mathematical correctness of the number. Instructors may choose to demonstrate the calculation by using the following steps:

1. Use the first eight digits of the Social Insurance Number for calculation
2. Multiply each of the second, fourth, sixth and eighth by two
3. Add the digits of the results in step two (eight numbers)
4. Add the first, third, fifth and seventh digit in the Social Insurance Number
5. Add the results of step 3 and 4
6. Subtract the result of step 5 from the next highest number ending in zero, the result should be the last digit in the Social Insurance number.

The following example shows the calculation:

1. Social Insurance Number given is 990 101 065
2. Multiply each of the second, fourth, sixth and eighth by two  
 $(9 \times 2) = 18$ ,  $(1 \times 2) = 2$ ,  $(1 \times 2) = 2$ ,  $(6 \times 2) = 12$

3. Add the digits of the results in step two (eight numbers)  
 $+1+8+0+2+0+2+1+2=16$
4. Add the first, third, fifth and seventh digit in the Social Insurance Number  
 $+9+0+0+0=9$
5. Add the results of step 3 and 4  
 $+16+9=25$
6. Subtract the result of step 5 from the next highest number ending in zero, the result should be the last digit in the Social Insurance number.  
 $+20-25=5$

---

***LO3 Determine if an organization is impacted by Federal or Provincial employment legislation***

---

If a worker is deemed to be an employee, then the next important step is to determine the jurisdiction that applies to the employment contract. This is important to understand whether federal or provincial employment standards are applied for payroll purposes.

The general rule is that an employer is specifically included under federal legislation if their operations fit into designated federal controlled industries as outlined in the text. If the employer is not specifically under federal jurisdiction, then they must follow provincial legislation and regulations.

Instructors may want to refer to the following website for class discussion:  
<http://www.labour.gc.ca/eng/regulated.shtml>

---

***LO4 Understand the stakeholders in the payroll process***

---

The balance of the chapter examines the various stakeholders in the payroll administration for an employer. This section can be used for active class discussion on identifying the stakeholders and what their interest is for the accurate and timely processing of payroll.
